Water of Life Water Filter - Tony Lamb, POB 41, Dardanelle, AR 72834

(VIRUS WARNING): It is NOT safe to filter water from any source (other than treated or known to be safe water) filter it and drink it. (How to make any water safe to drink!)

VIRUS WARNING: If you are filtering chlorine treated tap water, treated swimming pool water, 'posted as safe water' from a spring source you will not need to treat your water for viruses.

BUT if you are under a boil order or filtering water from ANY untreated source, such as a lake, stream, pond, creek, untreated swimming pool or spa you will need to treat that water to kill any viruses that may be present in the water.

(These filters are very good at filtering out about every harmful compound, 'BUT NO gravity filter' can remove viruses as they are just too small for gravity filters to remove.)

There are 3 easy and economical ways of killing viruses in your water before you filter it.

1. **Swimming pool Shock** (powdered Chlorine) IF you have about 4 to 5 gallons of water you are needing to filter first take your smallest measuring spoon $\frac{1}{4}$ level teaspoon of swimming pool shock and place it in a 5 gal. bucket of water and gently stir. Cover it with cheese cloth and let sit 24 hours before filtering it through your water filter. If it is properly stored pool shock will keep a very long time.
2. **Bleach, common household bleach** is another form of chlorine. Follow the same instructions but with bleach you will add 4 drops of bleach to every gallon of water. Gently stir it in the water cover it with cheese cloth and let sit for 24 hours before you filter it. Liquid bleach has a tendency to break down after it has been stored over a year.

* Bleach & shock are a poison and should be handled with care. NEVER DRINK CHLORNATED WATER unless you are sure it is safe to do so. Your filter should remove 99% of the chlorine in the water, the 24 hour waiting period is just a precaution to let the chlorine naturally dissipate before you filter it to drink.

3. I now offer a **UV light Kit. Ultra Violet light kills viruses.** Ultra Violet Light Set that you add to your existing water filter to kill viruses in any suspect water you need to filter for drinking. This is sold for donation ONLY. See this light set here:
<https://www.ebay.com/itm/185646830637> The advantage of UV light is you do not have to wait 24 hours to filter the water. BUT you should wait at least 30 minutes before drinking UV treated water

If you smell or taste chlorine in your drinking water STOP – DO NOT DRINK IT, test it, let it stand in an open top container for 24 hours and filter it BEFORE drinking it.
